## 7-4

### Solving Systems: Linear Transformations

Solve each system.

1)  $\begin{cases} 2x + y = 8 \\ 3x - 2y = 5 \end{cases}$

Multiply the first equation by 2 so the y's are opposite and will cancel when the equations are added.

$$\begin{array}{r} 4x + 2y = 16 \\ 3x - 2y = 5 \\ \hline 7x = 21 \\ \underline{7} \end{array}$$

$x = 3$

Then substitute the answer for x back into one of the original equations to find the y value.

$$\begin{aligned} 2(3) + y &= 8 \\ 6 + y &= 8 \\ y &= 2 \\ \{(3, 2)\} \end{aligned}$$

We have to multiply both equations by a number to get the q coefficients to be 10 and -10, thus canceling them out when adding.

2)  $\begin{cases} 5p - 2q = 1 \\ 4p + 5q = 47 \end{cases}$

$$\begin{array}{r} 25p - 10q = 5 \\ 8p + 10q = 47 \\ \hline 33p = 52 \end{array}$$

$$\frac{33p}{33} = \frac{52}{33}$$

$p = \frac{52}{33}$

$$\begin{aligned} 5\left(\frac{52}{33}\right) - 2q &= 1 \\ -15 + 15 - 2q &= 1 - 15 \end{aligned}$$

$$\frac{-2q}{-2} = \frac{-14}{-2}$$

$q = 7$

$\left\{\left(\frac{52}{33}, 7\right)\right\}$
